

**Open the file** called plugin.php in VS Code or any code editor.

**Find the question** you want to change — for example: *"What is your biggest worry at the present moment?"*

**Add a new button option** for your question — like *"New Option"*.

```
<div id="question1" class="question-container">
  <h2 class="hide-main-question" style="text-align: center; color: #28a745;">What is your biggest worry at the present moment?</h2>
  <div class="button-group">
    <button class="next-question" data-target="show_childquestions" >My Children</button>
    <button class="next-question" data-target="show_workquestions" >Work</button>
    <button class="next-question" data-target="show_relationshipquestions" >My Relationship</button>
    <button class="next-question" data-target="" >New Option</button>
  </div>
</div>
```

In that new button, you will **write a name** in something called data-target. That name will be used to show the next question.

```
<div id="question1" class="question-container">
  <h2 class="hide-main-question" style="text-align: center; color: #28a745;">What is your biggest worry at the present moment?</h2>
  <div class="button-group">
    <button class="next-question" data-target="show_childquestions" >My Children</button>
    <button class="next-question" data-target="show_workquestions" >Work</button>
    <button class="next-question" data-target="show_relationshipquestions" >My Relationship</button>
    <button class="next-question" data-target="show_newoption" >New Option</button>
  </div>
</div>
```

Now, **make a new function** in the file using the same name you wrote in data-target. This will be your new question.

```
<div id="question1" class="question-container">
  <h2 class="hide-main-question" style="text-align: center; color: #28a745;">What is your biggest worry at the present moment?</h2>
  <div class="button-group">
    <button class="next-question" data-target="show_childquestions" >My Children</button>
    <button class="next-question" data-target="show_workquestions" >Work</button>
    <button class="next-question" data-target="show_relationshipquestions" >My Relationship</button>
    <button class="next-question" data-target="show_newoption" >New Option</button>
  </div>
</div>

<?php
return ob_get_clean();
}

function show_newoption()
{
  <div id="question1" class="question-container">
    <h2 class="hide-main-question" style="text-align: center; color: #28a745;">What is your biggest worry at the present moment?</h2>
    <div class="button-group">
      <button class="next-question" data-target="show_childquestions" >My Children</button>
      <button class="next-question" data-target="show_workquestions" >Work</button>
      <button class="next-question" data-target="show_relationshipquestions" >My Relationship</button>
      <button class="next-question" data-target="show_newoption" >New Option</button>
    </div>
  </div>
}
```

Inside that function, **create a box (div)** to show your question. The **ID of the box must match** the name you used in data-target.

(For example, if your data-target is show\_newoption, your box ID should also be show\_newoption.)

```
function show_newoption()
{
    ob_start();
    ?>
    <div id="" class="question-container">

    </div>

    <?php
    return ob_get_clean();
}
```

Inside the box, **write the new question** you want to ask the user.

```
function show_newoption()
{
    ob_start();
    ?>
    <div id="show_newoption" class="question-container">
        <h2 class="hide-main-question" style="text-align: center; color: #28a745;">YOUR NEW QUESTION</h2>
    </div>

    <?php
    return ob_get_clean();
}
```

Then, **add one or more buttons** as answer options:

- If clicking the button should lead to another question, give it a new data-target.
- If clicking the button should send the user to a coach page, change the button type to use a data-url instead of data-target.

```
function show_newoption()
{
    ob_start();
    ?>
    <div id="show_newoption" class="question-container">
        <h2 class="hide-main-question" style="text-align: center; color: #28a745;">YOUR NEW QUESTION</h2>
        <div class="button-group">
            <button class="next-question" data-target="NAME OF YOUR NEXT QUESTION THAT APPEAR WHEN USER CLICK" >Option 1</button>
            <button class="final-answer" data-url="YOUR URL WHERE YOU WANT TO REDIRECT" >Option2</button>
        </div>
    </div>

    <?php
    return ob_get_clean();
}
```

Now, if you added any sub-question using a new data-target, **repeat steps 5–8** to create a new function and question for that too.

Finally, go to the big function in the file called questions\_plugin\_render

```
function questions_plugin_render()
{
    $output .= yourfunctioname();
}
```

Inside that function, **add a line that includes your new question**, so it will appear in the quiz when the page loads.

```
function questions_plugin_render() {  
  
    $output .= yourfunctionname()  
}
```
